

# EDGE RENEWABLES

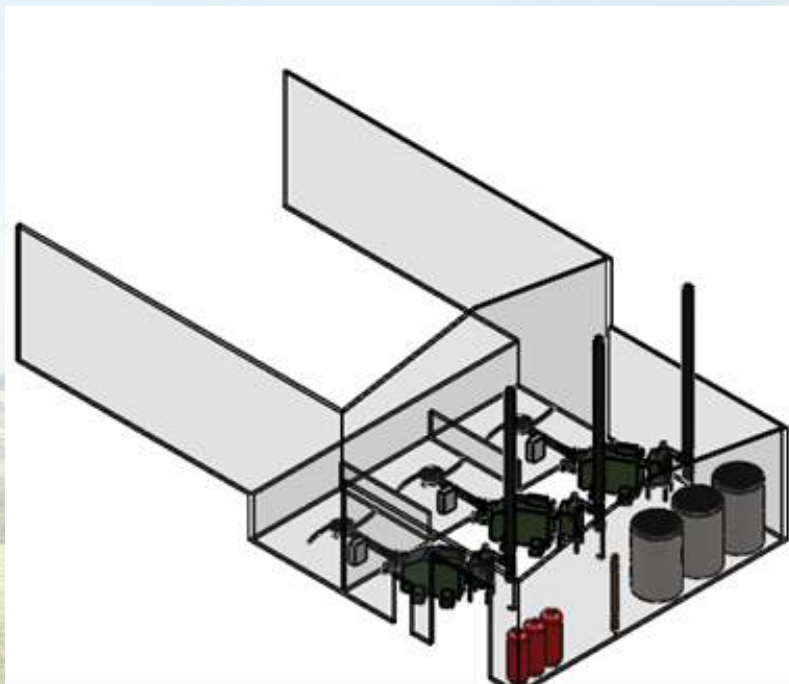

## Hill Farm, Herefordshire

### *Situation...*

A Herefordshire chicken farmer took the decision to move from the traditional LPG heating system for his 4 poultry sheds to the renewable biomass solution.

Edge Renewables were appointed to design and install a system that would provide the heat demand for the four poultry sheds.

Three HDG Compact 200 boilers, into a purpose built boiler shed with the chip store situated at the back. The FRA chip extraction augers were linked in to the chip store so that the chip was automatically fed in to the boilers which then heated the four poultry sheds.

For further information regarding this case study please do watch the biomass video in the Case Studies section of the website.
