

## CASE STUDY: BIOMASS BOILER INSTALLATION

## ETA Biomass Boiler installed at Shropshire Building Supplies

*The installation of a 140kW biomass-fuelled boiler system and renewable fuel storage facilities to heat the shop and offices at Shropshire Building supplies*

Faced with ever-increasing bills for heating the shop and offices with traditional, gas boilers, the owner of Shropshire Building Supplies needed to find a way of lowering their energy costs, whilst ensuring that the environment could also benefit by a reduction in the site's carbon emissions.

Recognising the benefits that biomass heating offers, coupled with the availability of the Government's Renewable Heat Incentive (RHI) - which pays a site's owner for the heat produced by eligible renewable technologies (such as biomass wood pellets) over a 20-year period - the owner decided to replace the gas heating system with a fully-automated biomass boiler.

Having engaged Edge Renewables of Shropshire to design, install and commission the biomass boiler-complete

with fuel-handling and control systems, the installation was completed and commissioned in September 2015.

*The heat is provided in the shops using two Dunham Bush heaters with built in heat exchangers*

### Headline Figures:

- Total capacity of 140kW
- 20 year estimated savings of £208,000.
- Payback within 9 - 10 years.
- Annual RHI Income of £8,200.

## CASE STUDY: BIOMASS BOILER INSTALLATION

### System Information

The system's total installed capacity of 140kW is achieved with one **ETA Hack** high-efficiency biomass boiler with low emission levels. The boiler provides heat for the two offices and busy shop, and having automatic ignition, self-activated cleaning and large ash containers, it has been integrated into the automated control system to provide the client with an easy-to-use heat source.

In order to level out the peaks in the site's heat demands, Edge Renewables has incorporated two insulated heat accumulator tanks within the biomass room. This allows for the automated sequence controls to store and release heat in the most economical way – quickly responding to the site's demands.

There are two 1,500 litre storage tanks used on the site.

The heat produced is piped to each of the locations on the site by a highly-efficient buried pre-insulated pipe network.

*The boiler installed within the plant room.*

### Fuel

The new system burns wood pellets, that conforms to the EN 14961-2 specification with a moisture content of below 10% when delivered to site.

These pellets are blown into the store whilst extracting the unwanted dust associated with blown delivery.

*The new 11.5 tonne pellet silo and new hot water cylinder within the offices*

### The Renewable Heat Incentive (RHI)

Following the commissioning of the project in 2015, the installation has been registered for the UK Government's non-domestic Renewable Heat Incentive (RHI) scheme.

This scheme was designed to encourage the uptake of renewable heat technologies such as biomass boilers and pays the owner of a qualifying installation to generate renewable heat for a period of 20 years.

A Heat meter was installed at the site to record the usage of the system and provide accurate readings to enable the RHI payments to be successfully claimed.

This will pay back the cost of the biomass boiler installation, in around nine years – thereby making a sound financial investment which will provide a comfortable return on the client's capital expenditure over the 20-year period.

### Carbon Savings

As the system uses a sustainable wood fuel, which has absorbed carbon dioxide whilst it was growing, using it in a highly-efficient biomass boiler results in large savings in carbon emissions – when comparing it to the traditional alternatives using fossil fuels such as oil, LPG and natural gas.

### About Edge Renewables (Shropshire)

Formed in 2011 in Much Wenlock, Shropshire, the company specialises in the design and installation of renewable energy technologies for homes, farms and businesses - such as biomass boilers and solar PV systems. In addition to this, the company also produces wood chip biomass fuel - a 'green', renewable fuel that is helping reduce the UK's dependence on fossil fuels.

In an annual report released by Ofgem for its RHI scheme - it was found that since its inception in November 2011, as of March 2013, Edge Renewables' clients accounted for some 19% of the total eligible heat generated under the RHI programme.
